

# Links to pages in Rebel Toolkit

Normally the URL (web address) of a page in the Rebel Toolkit includes the name of the book it is in and the name of the page. This can cause problems if you make a link to a page and then the page gets renamed or moved to another book. The Bookstack software keeps a list of old page names, so links sometimes continue to work, but not always.

Each page is actually identified by a number which does not change, and you can use that number in a link.

To find the static link for a page:

- Go to the page you want to make a link to
- Highlight a piece of text by double clicking on a word. The word gets highlighted.
- A pop-up box appears - in that pop-up box you will see the unique address of the page and a fragment identifier. The fragment identifier is the part after the "#" which identifies a particular paragraph within the page.
- Copy the address and remove the fragment identifier so you don't want to link to a part of the page.

For example the address of this page is `https://rebeltoolkit.extinctionrebellion.uk/link/463`. So you can make a link like this: [Links to pages in Rebel Toolkit](https://rebeltoolkit.extinctionrebellion.uk/link/463) which will continue to work even if the page is moved.
